AB - J62155203 Disinfecting compsn. contains as a cationic surfactant an
 inorganic peroxide and an activator for the inorganic peroxide.

- The cationic surfactant is pref. an alkyltrimethylbenzyl ammonium salt,
 an subst. benzalkonium salt, a benzenetrium salt, a dialkyltrimethyl
 ammonium salt, etc. The peroxide is pref. a sodium percarbonate,
 sodium perborate, sodium pertripolyphosphate, sodium perpyrophosphate,
 sodium persulfate, etc.

- Addition of the activator increases the disinfecting effect. Examples
 are glucosepentacetate, glucose tetracetate, fructose pentacetate,
 sucrose octacetate, sorbitane tetracetate, sorbitol hexacetate, and
 acetic acid esters of polyhydric alcohols; and tetracetyl

ethylenediamine, tetracetylglycolyl lauryl and like N-acetylated prod.
 - The amt. of inorganic peroxide is 0.1-10 pts. wt. of the cationic
 surfactant. The compsn. is generally formulated as dust, granule and
 tablet, and at the time of use is diluted with water. The use concn.
 is generally 10-1,000 ppm.

- ADVANTAGE - The compsn. disinfects even in the presence of organic
 material such as excrements. When cationic surfactant having
 disinfecting activity is used alone in presence of excrements in
 animal pens.
